/note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site 1: Not 1; Site 2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL)9W, testis NH7, and B-cell NCL_CGAP_CCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. "

This sequence belongs to sequence cluster 1181.f For invitrogen. This sequence belongs to sequence cluster 1181.f For the configuration about this cluster, see the configuration about this cluster, see the configuration about this cluster, see the configuration about this cluster. Gallocation of the configuration is flangelifetech.com Will: the configuration is flangelifeted. The configuration is the configuration of the configuration in the configuration is configurated. The configuration is configurated by Avenue Genoscope sequence ID: CSOCAPOO6BH12QP1.

/note="finverse PCR was performed on brosophila
melanogaster strains each of which contains a single P
rransposable element insertion that is thought to cause
either lethality or sterility. The resultant fragment for
each strain was directly sequenced to determine the
genomic sequence at the site of insertion. Details of the
protocols used can be found at
http://fruitfly.berkeley.edu/p_disrupt/inverse_pcr.html."

complementary strand of a polymelectide which comprises a 5'-end sequence and an oligonuclectide which comprises a 5'-end sequence and an oligonuclectide comprises a 3'-end sequence complementary to a polymuclectide which comprises a 1'-end sequence complementary to a oligonuclectide comprises at 1'-end sequence complementary to a specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polymuclectides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs are also useful for the AAH13613 to AAH13613 to AAH13613 to AAH13613 to AAH13613 to AAH13613 and AAH13613 to AAH13613 to AAH13613 to AAH13613 and the present human amino acid sequences; and AAH13629 to AAH13612 represent concleoutides, all of which are used in the exemplification of the

conditions, e.g. to the abolator, or years Arthory are incoming generate fusion proteins AABB1180-B51431. The genes can be used to generate fusion proteins by linking to the gene for the human common proteins by linking to the gene for the human conditions, e.g. by protein or gene therapy. The genes are isolated from conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the disgnosis, treatment and prevention of: (a) cancer, e.g. breast and cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allestgies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) canding anaemia allegates ampocardial ischemias; (d) wound healing canding and ulcerative colitis; (c) canding and protein as myocardial ischemias; (d) wound healing canding and ulcerative colitis; (d) canding

The invention relates to nucleic acid sequences (AAV84411 to AAV84633)

cocding human secreted proteins (AAW88534 to AAW886756). The secreted

protein gene sequences are deposited with the ATCC under deposit numbers

CC protein gene sequences are deposited with the ATCC under deposit numbers

CC 209011, 209080, 209081, 209083, 209084, 209085, 209009, 209010,

CO 209011, 209080, 209081, 209083, 209084, 209085, 209101,

CC sequences are used for the recombinant production of the secreted

CC sequences are used for the recombinant production of the secreted

CC proteins. The polynucleotide and animo acid sequences are useful for are

Useful for preventing, treating or ameliorating medical conditions e.g.

CC by protein or gene therapy. Pathological conditions can be also diagnosed

CC by determining the amount of the new polypeptides in a sample or by

CC determining the presence of mutations in the new polynucleotides, based on

CC specific uses are described for each of the polynucleotides, based on

CC specific uses are described for each of the polynucleotides, based on

CC specific uses are described for each of the polynucleotides, based on

CC specific uses are described for each of the polynucleotides, based on

CC disorders, developmental abnormalities and foortal deficiencies, blood

CC disorders, hepatic and renal disease of the immune system, autoimmune

CC disorders, prostate diseases, lymphomas, inflammation, allergies,

CC such as osteoporosis, arthritis or malignancies, diseases of testes, lung

CC or thymus, diseasis, bendocine disorders, infections and AIDS. The

CD Dypeptides are also useful for identifying their binding partners. The

                                                                                                                                                                                                           proteins (I) and polynucleotide (II) sequences. (I) and (II) have various activities based on the tissues and cells the genes are expressed in.

Example of these activities include: immunomodulatory; antisclerotic; dermacological; immunosupressive; antiinflammatory; immunostimulant; antipartimocnian; antimucorpial; antionvulsant; antialzheimers; vascular; antiparkimsonian; antimicrobial; and vulnerary. (I) and (II) can be used in gene therapy and vaccine production. (I) and (II) can be used in the diagnosis and treatment of immune disorders (e.g. multiple sclerosis, systemic lupus erythematosus and human immunodeficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher's disease) (e.g. cancers and Changa's cardiomyopathy and coronary arteriosclerosis), angiogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy, neurological disorders (e.g. Huntington's chorea, and laser promoting wound healing, regeneration and/or chemotaxis. ABAB185 to the proposition of the exemplification of the proposition of the proposition of the exemplification of the coronary arteriors and the exemplification of the proposition of the exemplification of the coronary regions of the proposition of the exemplification of the coronary cancers and the proposition of the exemplification of the coronary cancers and the coronary regions of the proposition of the exemplification of the coronary cancers and the coronary regions of the exemplification of the coronary cancers and the coronary regions of the coronary cancers and the coronary regions of the coronary cancers and the coronary regions of the coronary cancers and parkingon's disease and parkingor regions of the coronary cancers and the coronary regions of the coronary cancers and parkingor regions of the coronary cancers and coronary regions of the corona

The invention relates to an isolated HEMAEBO protein. The protein is useful for preparing a composition for diagnosing or treating autoimmune disorders e.g. multiple sclerosis and systemic lupus erythematosus; haematopoietic cell disorders e.g. agammaglobulinaemia and ataxia telangiectasia; blood coagulation disorders e.g. afibrinogenaemia and thrombocytopenia; allergy; graft-versus-host disease; inflammatory conditions e.g. ischaemia-reperfusion injury and arthritis; chyperproliferative disorders e.g. cancer and purpura; infectious disease e.g. viral infection and bacterial infection. The polymucleotide or protein can be used to regenerate damaged tissue e.g. ulcers and Alzheimer's disease. The present sequence reperseents a novel human careful protein CDNA. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at the content of the printed specification but was obtained in electronic condata.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                , Ruben SM, Rosen CA, Hu J;

The invention relates to an isolated protein comprising amino acid residues 33-205 or 1-205 of a novel human secreted protein appearing as ABO26252. The protein sencoded by one of 238 disclosed CDNA sequences encoding 238 secreted proteins. ABO26252 is a precerbellin-like protein. Also included are a composition comprising the protein and a carrier and an isolated protein produced by expressing the protein and a carrier and or isolated protein produced by expressing the protein cited above by a cell, and recovering the protein. The proteins are useful for diagnosing or treating neurodegenerative and behavioural disorders (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, Schizophrenia, mania, dementia, paranoia, psychoses or autism), immune disorders (e.g. hepatchlastoma, jaundice, hepattitis), immunological disorders (e.g. AIDS, leukaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    , Ruben SM, Rosen CA, Hu J;

The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune

nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5' end sequence and an oligonucleotide which comprises a 3'-end sequence complementary to a complementary strand of a polynucleotide which comprises a 3'-end sequence, where the combination of oligonucleotide which comprises a 1'-end sequence, where the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the comprises and the grainer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in comprises the remaining of the proteins encoded by the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs casily without any specialised methods. AdMO3166 to AdM13628 and AdM13633 reparesent human amino acid sequences; and AdM13632 reparesent consideration of the consideration of the complexities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2140

                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                    The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM8642-AAM4213) with nootropic, immunosuppersant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system classes, such as localised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic localised neuropathies and central nervous system suppression, at alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral solerosasis, and Shy-Drager Syndrome. Other uses include the cutilisation of the activity, chemotextic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 123

The proteins and their coding sequences are useful for treating a disease associated with NF-kappaB activation, such as inflammation, autoimmune diseases, infectious diseases, bone diseases, AIDS, neurodegenerative diseases, or ischaemic disorders.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM81170 to AAV31921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleorides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For

example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) polymucleotides may be used to produce the secreted (1), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (1) proteins and polymucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic derived cells. AAK64703 to AAK8764 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK45492 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention

3224 human nervous system antigen polypeptides, diagnosing and/or treating nervous system cancers Nucleic acids encoding useful for preventing, and metastases.

Disclosure; SEQ ID NO 8415; 1701pp + Sequence Listing; English.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The mucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) and sequences given in AAM81170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polymucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polymucleotides may be used to produce the secreted (I). by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polymucleotides may be used to protein. (I) additionally cancers and cancer metastases of haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic artisen genomic cancers and capresent human immune/haematopoietic artisen genomic sequences from the present invention. AAK54930 and AAM82169 represent invention. Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis. Disclosure; SEQ ID NO 40448; 3071pp + Sequence Listing; English. The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (GS) identified by CC (GCA), by detecting the level of expression of gaiven in the specification, and comparing the expression level to an expression level in an unactivated GC, where differential expression of Gs is indicative of GCA. Also included are condulating (M2) GAA by contacting GC with an agent that alters the expression of at least one gene in GS; (2) screening (M3) for an agent capable of modulating GCA or an inflammation (especially chronic) in a cissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the gene expression of crissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene (S) from GS, where the level of expression in a sample of the tissue of gene (S) from GS, where the level of expression of the gene is indicative of inflammation; (4) treating (M5) an inflammation (especially chronic) or in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by conteacting a tissue having inflammation with an agent that modulates the expression of gene(S) from GS, M3 is useful for detecting an inflammation in a tissue, M4 is useful for modulating GA, M3 is useful for exposure of a subject to a pathogen or sterile inflammation in a tissue, M4 is useful for detecting an inflammation in a tissue, M4 is useful for modulating GA, preferably in an inflammation in a tissue, M4 is useful for detecting an inflammation (especially chronic) in a tissue, an altergic response in a subject to a pathogen or sterile inflammation (especially chronic) arthritis, glomerulonephritis, asthma, thrombosis, cardiac reperfusion injury, renal reperfusion injury, senal reperfusion injury, senal reperfusion injury, senal reperfusion injury, senal reperfusion injury, s Claim 1; SEQ ID NO 142; 114pp; English.

Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic genes associated with granulocyte activation, which serves as diagnostion markers that is useful for monitoring disease states and drug toxicity.

WPI; 2002-435328/46.

Sequence 41896, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

APPLICANT: Homburger et al.

TILLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster;

FILE REPERENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT FILING DATE: 1999-03-17

NOWHER OF SEQ ID NOS: 62517

SEQ ID NO 41886

LENGTH: 323

LENGTH: 323
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 37, Application US/08630915A

Patent No. 630920

GENERAL INFORMATION:
APPLICANT: SPAKES, Andrew B.
APPLICANT: FOWLKES, Dana M.
APPLICANT: KAY, Brian K.
APPLICANT: KAY, Brian K.
APPLICANT: KAY, Brian K.
APPLICANT: MCCONNELL, Stephen J.
TITLE OF INVENTION: POLYPEPTIDES HAVING A FUNCTIONAL
TITLE OF INVENTION: USING SAME
NUMBER OF SEQUENCES: 227

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Note: two forms of the inhibitor were isolated; the amino end of the longer form is blashote: two forms of the inhibitor were isolated; the amino end of the longer form were sequenced only for the shorter form
C;Comment: This protein inhibits elastese and trypsin simultaneously and independently.
C;Superfamily: Bowman-Birk proteinase inhibitor; Bowman-Birk inhibitor repeat homology c;Reywords: blocked amino end; duplication; serine proteinase inhibitor
F;18-44/Domain: Bowman-Birk inhibitor repeat homology cBB2>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Trypsin inhibitor precursor (clone ATI21) - alfalfa
Nylternate names: serine proteinase inhibitor
Cispecies: Medicago sativa (alfalfa)
Cispecies: Sef48; S49118
RymGurl, B.: Mukherjee, S.; Kahn, M.; Ryan, C.A.
Plant Mol. Biol. 27, 995-101, 1995
